

HIPRAPOX

Live vaccine against Fowl pox virus, FPV92 strain, in injectable freeze-dried tablet

COMPOSITION PER DOSE:

Live fowl pox virus, FPV92 strain $\geq 10^{3.5}$ EID₅₀

Fowl pox is a common viral disease of poultry. The disease is distributed worldwide in one of its two forms, cutaneous or diphtheritic (wet pox).

LABORATORIOS HIPRA, S.A. produces the vaccine HIPRAPOX using a strain of fowl pox virus, attenuated, which cannot induce the disease and it effectively protects vaccinated birds.

INDICATIONS:

Chickens (Broilers, Layers and Breeders) and Turkeys: To prevent Fowl pox, both in the cutaneous or diphtheritic forms in chickens (broilers, layers and breeders) and turkeys.

DOSAGE:

Chickens and Turkeys: 1 dose/bird.

ADMINISTRATION FORM AND ROUTE:

Chickens: Dissolve the freeze-dried tablet in the solvent. Extend the wing membrane. Apply carefully the vaccine by puncturing the membrane in a manner that does not provoke lesions in the blood vessels. The needle must be freshly impregnated with the vaccine solution when performing each administration.

Turkeys: Dissolve the freeze-dried tablet in the solvent. One drop of the vaccine solution will be applied by follicular scarification in the thigh.

Vaccination programme recommended:

Broilers: They can be vaccinated from one day of age.

Layers and Breeders: Vaccinate between the 8 and 12 week of age. In areas of high risk of the disease, the vaccination can be administered on the day of hatching, revaccinating before the laying period.

Turkeys: They can be vaccinated from one day of age.

WITHDRAWAL PERIOD:

0 days.

CONTRAINDICATIONS: None has been described.

ADVERSE REACTIONS:

- After 7-10 days post-vaccination, one or two nodules should appear at the injection site which transform into scabs ("take"), indicating that the bird has been vaccinated. The scabs will disappear within 2-3 weeks after the vaccination.

SPECIAL PRECAUTIONS FOR USE:

- Do not vaccinate diseased birds, only those that are healthy.
- Check the expiry date of the product.
- Use steril material.
- The solvent used to dissolve the freeze-dried tablet should not be a high temperature; it should not exceed 15 °C.
- Shake gently until complete resuspension of the freeze-dried tablet before administration.
- Once used, sterilize the vial and its content, as well as the two-pronged needle, by heat.
- Store at +2 to +8 °C, protected from light.
- In case of accidental self-injection, seek medical advice immediately and show the package insert or the label to the physician.
- Treat the disposable materials by boiling, incineration or immersion in a suitable disinfectant, which has authorised by the competent authorities.

PRESENTATION:

Pack with 5 vials of 1,000 ds + 5 vials of solvents.
